Digital Forensic Investigation Report

Prepared By:

Hanamariam Yehuala

Digital Forensic Investigation Report

Case Study: Identity Terrorist Recruitment Network

A number of people are reporting that terrorist group A is recruiting teenagers and youngsters to its network and engaging with them and exploiting its doctrine into their thought process. You have got some telegram and Facebook private groups that are suspected to be run by the group and you have some emails expected to be sent by the group. As a digital forensic investigation you and your team are given this assignment.

---

1. Digital Forensic Investigation Objective

The primary objective of this digital forensic investigation is to:

- **Identify the operators** of the suspected Telegram and Facebook groups, and confirm if they are affiliated with Terrorist Group A.
- **Verify** whether the emails linked to the case are actively being used as tools for recruitment, indoctrination, and radicalization, especially focusing on targeting youth.
- **Collect, preserve, and analyze digital evidence** that confirms the group's involvement in illegal activities, including recruitment for terrorism or violence.
- **Understand the group's network**, methods of communication, recruitment strategies, and exploitation of young individuals, specifically looking for ways they manipulate social media platforms.
- **Identify and confirm the involvement of terrorist group A** in recruiting teenagers and young individuals.
- **Extract and analyze** digital evidence from Telegram and Facebook private groups suspected of being operated by the group.
- **Examine emails** associated with the group to determine their origin, authenticity, and content.
- **Document findings** in a manner admissible in legal proceedings.
- **Ensure the integrity** and chain of custody of all collected digital evidence.
- **Present findings** in a professional manner for possible use in legal proceedings, including evidence for prosecution.

2. Questions and Hypotheses

Key Questions:

- Are the Telegram and Facebook groups operated by members of Terrorist Group A, and how do they maintain anonymity in their activities?
- What types of content (messages, videos, images, etc.) are shared within these groups? Do they contain propaganda or extremist ideologies?

- How do the emails connected to these groups contribute to recruitment? What patterns in communication can be identified?
- What specific indicators are there in the content, such as keywords, symbols, or cultural references, that suggest it is used for indoctrination?
- Who are the key individuals managing these platforms, and can they be traced back to known extremist groups?
- Are the Telegram and Facebook private groups being run by terrorist group A?
- What type of content is being shared within these groups?
- Are there patterns of recruitment, propaganda, or radicalization in the messages?
- Can we trace the administrators or key members of the groups?
- Do the suspected emails contain any evidence of recruitment or coordination?
- Can we identify IP addresses, metadata, or other digital footprints linking the accounts to known terrorist activity?

Hypotheses:

- **H1**: The Telegram and Facebook groups are actively operated by Terrorist Group A and are used to recruit, indoctrinate, and spread extremist ideologies.
- **H2**: The emails contain messages targeting young individuals, specifically teenagers or students, attempting to recruit them into extremist activities.
- **H3**: The groups use encrypted communication methods, anonymized accounts, and various obfuscation tactics to evade detection by law enforcement and intelligence agencies.
- **H4**: The content shared within these groups shows patterns of specific themes such as violence, political destabilization, or ethnic conflict, which are key to recruitment efforts.

3. Digital Forensic Investigation Procedures

Step 1: Planning and Legal Authorization

- **Legal Warrant**: Before beginning the investigation, the appropriate legal authority (e.g., law enforcement or judicial branch) must issue a warrant to access the suspected Telegram and Facebook groups. This may involve cooperation with social media platforms, such as Facebook, and communication platforms like Telegram.
- **Ethical Considerations**: Given the sensitive nature of the case, proper ethical standards for digital forensics, such as obtaining consent and safeguarding privacy, must be followed.
- **Defining the Scope**: The investigation's scope will focus on identifying recruitment materials, communications related to radical ideologies, and connections between users. Specific focus will be on emails and groups that may be targeting teenagers or vulnerable youth.

Step 2: Identification of Evidence Sources

- **Targeted Platforms**: Identify and map out the key Telegram and Facebook groups under investigation, including private groups that may have been set up for this purpose. A special focus will be on identifying groups linked to extremist rhetoric, such as those propagating political violence, extremist ideology, or other terrorist-related activities.
- **Email Metadata**: Collect and analyze the headers and metadata of emails associated with the suspected terrorist group. These should be used to trace the origin, path, and recipient of the messages to establish the connection to the terrorist group.
- **Shared Media**: Gather evidence of media files shared within the groups, such as propaganda videos, photos of violent acts, or images with extremist symbols (e.g., flags of banned groups). Analyze these media for content related to recruitment or calls for violence.

Step 3: Data Acquisition

- **Telegram and Facebook**: Using digital forensic tools such as **Magnet AXIOM** and **Cellebrite**, collect messages, shared files, and group metadata (e.g., member details, dates, locations).
- **Email Analysis**: Tools like **FTK Imager** can be used to extract email contents, headers, attachments, and IP addresses. Special attention will be given to how the email addresses are created (anonymized or suspicious domains).
- **Data from Mobile Devices**: Some group members may use mobile devices to engage in encrypted chats. Using tools like **Cellebrite UFED**, forensic experts can extract encrypted communications from mobile devices, including apps like Telegram, WhatsApp, or other secure messaging platforms.
- Secure access to Telegram and Facebook groups using undercover accounts where legally permitted.
- Obtain metadata, message history, and user details from the groups.
- Capture screenshots and log interactions where necessary.
- Preserve digital artifacts using forensic imaging tools to maintain data integrity.

Step 4: Preservation of Evidence

- **Write Blockers**: During acquisition, tools such as **write blockers** will be used to ensure no evidence is modified during collection. This is vital for maintaining the integrity of the data.
- **Hashing**: Use cryptographic hashing algorithms (such as **SHA-256**) to verify the integrity of the data during acquisition. This ensures no tampering with the data.
- **Chain of Custody**: Document all actions involving the collection, handling, and storage of digital evidence in a detailed **chain of custody** log. This includes noting the time, location, personnel involved, and specific actions taken on each piece of evidence.
- **Create forensic images** of all collected digital evidence using write-blockers and hashing techniques.
- **Maintain a strict chain of custody,** documenting every step of data handling.
- **Ensure compliance** with legal and ethical guidelines for digital evidence handling.

Step 5: Analysis of Evidence

- **Communication Patterns**: Using tools like **EnCase** or **FTK** to analyze chat messages, keywords, and user behavior within Telegram and Facebook groups. Focus will be placed on identifying recruitment techniques, including emotionally charged content or appeals to vulnerable groups (e.g., youth in political or economic turmoil).
- **Metadata Analysis**: Investigate metadata to identify connections between users, group administrators, and other suspicious accounts, including examining IP addresses, login times, and geographical locations.
- **Social Network Analysis**: **Maltego** or **Gephi** will be used to visualize and map out the social network of group members, identifying links between extremists and potential recruiters. This will assist in understanding how individuals are recruited, including identifying the key influencers within the network.
- **Media Analysis**: Conduct **forensic media analysis** on images, videos, and documents shared in the groups. This includes identifying visual or audio cues linked to extremist ideologies, using tools like **Autopsy** and **Wireshark** for deep content analysis.
- **Use forensic tools** to analyze chat logs, images, and shared files in Telegram and Facebook groups.
- **Examine email headers** to trace the origin and identify any potential spoofing.
- **Perform keyword analysis** to detect radical or extremist terminology.
- **Utilize network forensics** to trace IP addresses, geolocation, and device information.
- **Correlate findings** across multiple sources to establish connections and patterns.

Step 6: Reporting and Documentation

- **Detailed Findings**: Throughout the investigation, document all key findings with timestamps, screenshots, and detailed descriptions of evidence. Each piece of digital evidence should be clearly linked to the investigation's hypotheses.
- **Summary Report**: Prepare a **final report** summarizing the investigation, which will outline the digital evidence, methodologies, conclusions, and any potential legal actions. This report will also include a clear recommendation for removing extremist content, based on findings, to prevent future recruitment.
- **Legal Considerations**: The report will be prepared with consideration for future legal proceedings, including addressing how the evidence may be used to prosecute suspects. Special attention will be paid to the digital trail left by individuals within the groups.

4. Tools and Techniques

Evidence Acquisition Tools:

- **FTK Imager**: Used for forensic imaging and data preservation.

- **Wireshark**: Captures and analyzes network traffic for communication patterns.
- **Magnet AXIOM**: Used for extracting and analyzing social media data.
- **Volatility**: Memory forensics for deep analysis of digital artifacts.
- **OSINT Tools (Open-source intelligence)**: Maltego, Shodan, and SpiderFoot to gather additional intelligence.

Preservation Techniques

- **Write Blockers**: Prevent any accidental alteration of the evidence during the acquisition process.
- **Hashing**: Use of **SHA-256** for verifying the integrity of acquired data, ensuring that data remains unaltered from its original form.

Analysis Techniques:

- **Email Header Analysis**: Using tools like **MXToolbox** to trace email origins.
- **Chat Log Analysis**: Parsing text data to identify suspicious communication trends.
- **Network Forensics**: Identifying VPNs, proxies, and anonymization techniques used by the group.
- **Metadata Extraction**: Identifying timestamps, geolocation, and device fingerprints.
- **Sentiment Analysis**: Using NLP (Natural Language Processing) tools to analyze propaganda messages.

5. Results and Conclusion

Analysis Results

- **Telegram and Facebook**:
    - Content analysis identified multiple instances of **recruitment** videos, encrypted links to extremist propaganda, and posts celebrating violence. These posts used specific terms, including calls to action for youth to join “freedom movements” in the region.
    - Metadata analysis linked the Telegram group administrators to specific areas known for political instability, such as Oromia, where political resistance movements are prevalent.
    - Keywords like “unity,” “freedom,” and “rewards” were frequent, which aligns with recruitment rhetoric targeting vulnerable groups in conflict-prone regions.
- **Emails**:
    - The email analysis traced back to **anonymized servers**, suggesting a deliberate effort to mask identities. Some emails contained **attachments** such as recruitment brochures and extremist literature, with clear calls for action targeting young individuals, particularly from underrepresented ethnic groups.

- **Social Network Connections**:

- A **network graph** identified several individuals connected to known extremist figures within the region, indicating possible connections between the group and active insurgent movements.

Conclusion

This investigation confirms that the Telegram and Facebook groups are used by Terrorist Group A for recruiting and indoctrinating young individuals, using tailored messages targeting vulnerable youth. The analysis of the emails further supports this claim, providing substantial evidence of recruitment efforts.

Recommendations for Stakeholders

1. **Enhanced Monitoring**: Collaborate with local law enforcement and intelligence agencies to enhance monitoring of private social media groups for potential recruitment activities, especially among vulnerable youth.
2. **Collaboration with Social Media Platforms**: Work with platforms like Facebook and Telegram to remove extremist content and prevent further recruitment.
3. **Public Awareness Campaigns**: Launch education campaigns targeting young people in conflict-prone areas about the risks of online manipulation and radicalization.
4. **International Cooperation**: Increase cooperation with international agencies and neighboring countries to trace cross-border recruitment efforts and disrupt terrorist networks.
5. **Legal Action**: Share findings with law enforcement for appropriate legal proceedings.
6. **Further Surveillance**: Continue monitoring of digital communication channels.
7. **Awareness Programs**: Educate young individuals on online radicalization threats.
8. **Strengthening Platform Security**: Collaborate with Telegram and Facebook to dismantle extremist networks.
